

Pneumonia Detection

APS360-Group41

Pneumonia Detection

- Currently from chest scans, **physicians** are only able to correctly identify pneumonia with **47% to 69% accuracy**
- Increasing Demand for **a more accurate and efficient diagnosis**

Our Model:
84.3%

Why is it important?

Goal: detect Pneumonia based on the Chest X-Ray

- most common diagnosis for severe **COVID-19** is severe pneumonia
- **24.8** cases per **1000** adults are diagnosed with pneumonia diseases in the United States
- **one of the top ten leading causes of death** in Canada

Data Collecting

1

- Kaggle - "Chest X-Ray Images"
- 5,863 images
- Two classification labels
- Guangzhou Women and Children's Medical Center's retrospective cohorts of children aged one to five years old

2

Manual Quality Control

Loading Data into Notebook

4

Train/Validation/Test Split

5216 images in training

16 in validation

624 in testing

6:1:1

Training label Rebalance

5

6

Data Augmentation

- Horizontally flipping
- Shifting
- Shearing
- Zooming
- normalized

Choosing a Model

1.

Sequence in
Data

RNN

2.

Image
Recognition

CNN

Simple
Classification

3. In the Future

Autoencoders

GANS

Model: CNN

out_channels = 5
Kernel = 5×5
s = 1

Kernel = 2×2
s = 2

out_channels = 10
Kernel = 5×5
s = 1

Kernel = 2×2
s = 2

Flatten to
 $10 \times 53 \times 53$

input image

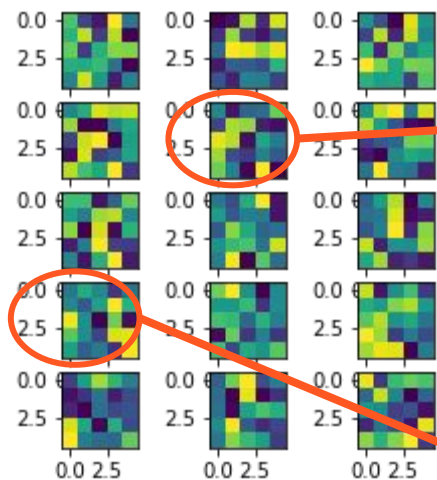

$3 \times 224 \times 224$

Confusion Matrix

Recall should be maximized

- **Precision** =
 $489/(489+72) = 0.87$
- **Recall** =
 $489/(489+97) = 0.83$

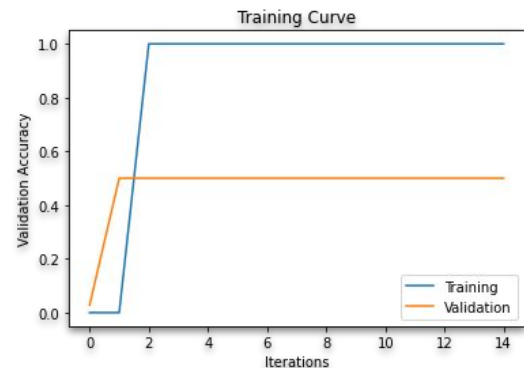

Baseline Model Comparison

ANN

Test Accuracy: 51.52%

Key Takeaways

**Importance of Data
Collection**

**How to Find the
Right ML Model**

**Evaluate the
Problem Properly**
